## Energy storage at power plants

Where is storage located in a power plant?

Storage can be located at a power plant, as a stand-alone resource on the transmission system, on the distribution system and at a customer's premise behind the meter. Do wind and solar need storage? All power systems need flexibility, and this need increases with increased levels of wind and solar.

Can energy storage systems be integrated with fossil power plants?

Several studies have been reported in the literature, particularly on power plant system modeling, and integration of sensible and latent heat-based energy storage systems with fossil power cycles. Liquid air energy storage (LAES) is another form of energy storage that has been proposed for integration with fossil power plants.

Are energy storage technologies a viable solution for coal-fired power plants?

Energy storage technologies offer a viable solution to provide better flexibility against load fluctuations and reduce the carbon footprint of coal-fired power plants by minimizing exergy losses, thereby achieving better energy efficiency.

Why do we need energy storage?

Because power systems are balanced at the system level, no dedicated backup with energy storage is needed for any single technology. Storage is most economical when operated to maximise the economic benefit of an entire system. Don't we need storage to reduce curtailment?
