## Flow batteries are used for

What are flow batteries used for?

Renewable Energy Source Integration: Flow batteries help the grid during periods of low generation, making it easier to integrate intermittent renewable energy sources like wind and solar. For example, flow batteries are used at the Sempra Energy and SDG&E plant to store excess solar energy, which is then released during times of high demand.

How do flow batteries work?

Flow batteries operate distinctively from "solid" batteries (e.g., lead and lithium) in that a flow battery's energy is stored in the liquid electrolytes that are pumped through the battery system (see image above) while a solid-state battery stores its energy in solid electrodes. There are several components that make up a flow battery system:

Are flow batteries a good choice for large-scale energy storage applications?

The primary innovation in flow batteries is their ability to store large amounts of energy for long periods, making them an ideal candidate for large-scale energy storage applications, especially in the context of renewable energy.

Why should you choose a flow battery?

Therefore, flow battery can be easily designed to meet specific energy capacity or power rating requirements. These characteristics make them suitable for a wider range of applications than conventional batteries. Another significant advantage is the long service life about 10,000 cycles at 75% depth of discharge.
