# Solar Light Night Vision System

How does night vision technology work?

Night vision technology works by amplifying existing light from the environment. This process, known as light amplification, makes it possible to see more clearly in low-light conditions. The most common method of achieving this is through the use of image intensifier tubes.

Why should you use a night vision camera?

No longer fear the darkness. With a bright built-in spotlight, your camera will light up at night when motion is detected. Enjoy round-the-clock full color recording, with available ambient light. If the camera is in complete darkness, it will activate infrared Night Vision to continue clearly recording in black and white up to 100 ft. away.

Why do you need a solar camera?

With a built-in solar panel and rechargeable battery, our cameras are designed to provide uninterrupted security. Whether you're protecting your home or business, enjoy the freedom to place cameras wherever they're needed without worrying about electrical outlets or dead batteries. Experience zero mandatory monthly fees and no hidden costs.

The systems' minimal maintenance requirements and long operational life align well with European sustainability standards and circular economy principles. Solar-powered IR ...
