# Uninterruptible power supply in indoor distribution box

What is an uninterruptible power supply (UPS) system?

Power distortions such as power interruptions, voltage sags and swells, voltage spikes, and voltage harmonics can cause severe impacts on sensitive loads in the electric systems.

Uninterruptible power supply (UPS) systems are used to provide uninterrupted, reliable, and high-quality power for these sensitive loads.

What is inside a power distribution box?

Inside every power distribution box, you'll find a set of components that help manage, control, and protect the electrical system. Here's a quick breakdown of the most important parts and what they do: Circuit Breakers (MCBs): These act like automatic guards.

What are emergency power distribution systems?

Ensure uninterrupted operations with emergency power distribution systems. These backup solutions, including standby generators and uninterruptible power supplies, safeguard against power outages in industrial and commercial settings.

How does a distribution box work?

Usually, a distribution box has circuit breakers or fuses that act as a shield to the wiring and appliances hooked to the electrical system. When anomalies arise like short circuits and overload, the circuit breakers cut the power supply in an attempt. It is done to suppress or prevent the system from being damaged or starting a fire.
